                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hybrid dimeric protein comprising two co-expressed units - each probased on receptor or ligand and a subunit of a heterodimeric hormone, especially FSH, for inducing follicular maturation Example; Pages 37-38; 60pp; English.

C. A novel fusion protein comprises 2 dimer forming co-expressed amino acid sequences, each consisting of a homodimeric or heterodimeric creceptor chain or ligand, with ligand-receptor binding activity, bound directly or via a peptide linker to a subunit of a heterodimeric protein hormone capable of forming a heterodimer with the hormone's other subunits. The fusion protein, e.g. the thrombopoietin (TPO)/human chorionic gonadotrophin-alpha subunit (hCG-alpha) fusion protein denoted by the present sequence, significantly increases the biological activity of the hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                            a receptor peptide.

Example A; Page 53-54; 93pp; English.

Hybrid peptides for binding cytokines, comprising a malaria parasite (plasmodium falciparum) peptide (capable of binding to a red blood cell (RBC)) and a receptor peptide are claimed. R70103-25 are examples of these hybrid peptides. R70107 is a fusion of tumour necrosis factor receptor (in accordance with H Loetscher et al Cell, Vol. 61, 351-359) and glycophorin binding protein (GBP) 130. The use of cytokine can bind harmlessly to the RBC without deleterious effect. The RBC protects the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA encoding TNF binding protein and TNF- receptor - used in tumour treatment and to understand mechanisms to TNF action Disclosure; Fig 1(1-3); Slpp; German.

Clone pTNF-BP15 was used to contruct pADTNF-BP, for transfection of e.g. COS7 cells. The expressed proteins are useful prophylactically and therapeutically to control disorders which involve the damaging effects of TNF-alpha or -beta (e.g. infectious parasitic diseases, shock, cachexia, autoimune diseases, adult respiratory distress syndrome etc., or side effects of treatment wit TNG-alpha). They can also be used as diagnostic reagents for assaying TNF and in study of TNF-receptor interactions.

and probably represent a signal sequence. Residues 35-40 are highly charged (DREKR) and this is not normally found in secretory signal sequences. It is possible the receptor is processed by proteolysis after residue 40 which contains a dibasic cleavage site (RR). Hydropathy analysis of this sequence predicts a single transmembrane domain of 23 amino acids, dividing the sequence into an extracellular domain of 171 residues and a cytoplasmic domain of 221 residues. The sequence contains a large number of cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GBP 130 or GBPH (GBP homologue) are the prefd. malaria parasite peptid used, others include EBA 175 (175 kDa erythrocyte binding antigen), PMMSA (pre major merozoite surface antigen) and the Duffy binding receptor molecule (eg. exhibited by Plasmodium vivax). These peptides bind to pref. glycophorin A, B and C, sialo glycoproteins, found on the surface of RBCs. The hybrid peptides are thus used to lower the levels of free cytokines in the circulation to reduce pathological
                                                                                                                   treating autoimmune disease, septic shock, HIV etc.

Example; Fig 1; 43pp; English.

This sequence was deduced from human TNF-alpha cDNA isolated as in Q24440. The first 35 amino acids are generally quite hydrophobic Q24440.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tumour necrosis factor alpha; extracellular binding domain; treatment; pulmonary diseases; septic shock; HIV infection; malaria; viral meningits; graft versus host disease;
                                                                                                                                                                                                                                   18-OCT-1990; GB-022648.

This sequence represents human p55 tumour necrosis factor (TNF-R). Expression of this receptor is regulated by shedding of the extracellular receptor fragment. The p55 TNF-R can be shed in response to different inducing agents, e.g. phorbol myristate acetate (PMA), depending on cell type. The only region of the receptor whose structure affects the shedding response is the spacer region (see R75012) in the extracellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 p55; tumour necrosis factor receptor; TNI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        38888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cc domain. This region is located close to a site of cleavage of the molecule, and links the Cys rich module to the transmembrane domain. The cc spacer region of the encoded protein was used to create the chimeras between human p55 TNF-R and murine epidermal growth factor receptor (EGF-R) that are represented by R75007-11. This spacer region was cc subjected to deletion mutations (R75013-25) and substitutions (R75013-25) and substitutions was cc (R75026-47). Of the spacer region, the most important residues are cc Asn 172, Val 173, Lys 174 and Gly 175, with Val 173 being the most comportant of these. The shedding of the receptor is independent of the conformation of these residues, with the exception of a limited component of the protein adversely effect the shedding process. Cc conformation of the protein adversely effect the shedding process. Cc The mutations shown in R75013-47 were introduced in order to create an cc inhibitor of a protease that is capable of cleaving the soluble TNF-R cc from the cell bound TNF-R. Fragments of these inhibitors can be seen in cc used for enhancing TNF function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

useful in treating the cytokine.

e.g. rheumatoid arthritis
Disclosure; Fig 1; 25pp; English.
The amino acid sequence is that of tumour necrosis factor alpha binding protein which contains the extracellular domain of human binding protein. It is soluble and can be used in the regulation of alpha receptor. It is soluble and sequestering the cytokine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    R20787

                                                                           The linker may comprise 5-100 amino acids selected from Gly, Asp, Ser, Thr and Ala. These linkers separate the individual moeities by such a distance that each component of the fusion protien is capable of folding into the secondary or tertiary structure required for its biological activity. These fusion proteins may be used in therapy, diagnosis and assays for conditions mediated by TNF or IL-1, particularly in conditions in which both TNF and IL-1 play a causitive role. They may be used to treat cachexia, rheumatoid arthritis, diabetes, multiple sclerosis, pulmonary fibrosis and silicosis, cerebral malaria, allograft and xenograft rejection in graft verses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New fusion protein tumour necrosis factor and human interleukin-1 receptor - useful in therapy, diagnosis and assays of e.g. rheumatoid arthritis, diabetes, cerebral malaria, sepsis, etc. disclosure; Page 57-59; 85pp; English.

The sequences given in R42058-59 repressent human tumour necrosis factor receptor (TNF-R) and the sequences in R42060-61 represent human interleukin-1 receptor (IL-IR). These sequences were used the production of a fusion protein which conformed to one of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; tumour necrosis factor receptor; TNF-R; interleukin-1 receptor; IL-1R; fusion protein; linker; TNF; IL-1, cachexia; cerebral malaria; rheumatoid arthritis; diabetes; multiple sclerosis; septic shock; pulmonary fibrosis; silicosis; allograft; xenograft; rejection; graft verses host disease; sepsis; inflammation; allergy;

Disclosure; Fig 21; 142pp; English.

The sequence comprises the entire 30 kD TNF inhibitor. The clo from which the sequence was deduced was isolated from a cDNA library prepd. from RNA form U937 cells treated with PMA/PHA. library prepd. from second into expression vectors for pre of TNF inhibitor for use in the treatment of inflammatory and degenerative diseases. The active protein is claimed (Claim 8 degenerative diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Partial amino acid sequences were determined for the 55 and 75kD TNF-BPS (see Ri1072-Ri1081) and oligonucleotide primers were synthesised based on these partial sequences. The primers were used to produce a cDNA fragment for use as aprobe to screen a human placental cDNA bank constructed in lambda gtll. Positive clones were identified and sequenced. DNA constructs comprising the TNF-BP coding sequence may also contain a fragment encoding a human Ig domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   improved TNF-binding properties.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pri malaria parasite peptide capable of binding a red blood cell and prepride.

Example A: Page 46-47; 93pp; English.

CC Hybrid peptides for binding cytokines, comprising a malaria parasite CC (Plasmodium falciparum) peptide (capable of binding to a red blood CC (Plasmodium falciparum) peptide are claimed. R70103-25 are examples CC (Plasmodium falciparum) peptide are claimed. R70103-25 are examples CC ell (RBC)) and a receptor peptide are claimed. R70103-25 are examples CC of these hybrid peptides. R70103 is a fusion of tumour necrosis factor CC receptor (in accordance with H Loetscher et al Cell, Vol. 61, 351-359) CC and glycophorin binding protein (GBP) 130. The use of cytokine can bind CC thindrance prevents the cytokines means that the cytokine can bind CC hybrid peptides from excretion from the kidney, and due to steric CC hindrance prevents the cytokines binding to a receptor in another cell. CC GBP 130 or GBPH (GBP homologue) are the prefd. malaria parasite peptides used, others include EBA 175 (175 kDa erythrocyte binding antigen), CC PMMSA (pre major merozoite surface antigen) and the Duffy binding CC receptor molecule (eg. exhibited by Plasmodium vivax). These peptides CC bind to pref. glycophorin A, B and C, sialo glycoproteins, found on CC the surface of RBCs. The hybrid peptides are thus used to lower the levels of free cytokines in the circulation to reduce pathological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC cell (RBC)) and a receptor peptide are claimed. R70103-25 are examples CC of these hybrid peptides. R70108 is a fusion of tumour necrosis factor CC receptor (in accordance with H Loetscher et al Cell, Vol. 61, 351-359) CC and 91ycophorin binding protein (GBP) homologue (GBPH). The CC use of cytokine receptors not normally found on RBCs means that the CC cytokine can bind harmlessly to the RBC without deleterious effect. CC The RBC protects the hybrid peptides from excretion from the kidney, and CC due to steric hindrance prevents the cytokines binding to a receptor in CC another cell. GBP 130 or GBPH are the prefd. malaria parasite peptides CC used, others include EBA 175 (175 kDa erythrocyte binding receptor CC composed to the surface antigen) and the Duffy binding receptor CC molecule (eg. exhibited by Plasmodium vivax). These peptides bind to CC pref. 91ycophorin A, B and C, stalo 91ycoproteins, found on the surface CC cytokines in the circulation to reduce pathological damage.

S Disclosure; Fig 91(1-2); 51pp; German.

C LambdarNF-R2 encodes the complete human TNF-R2 and was used to screen the HS913T cDNA library.

C LambdarNF-R2 encodes the complete human TNF-R2 and was used to construct a plasmid (pADTNF-R) expressing the product the same way as pADTNF-BP (see Q06282). The expressed proteins are useful prophylactically and therapeutically to control disorders which involve the damaging effects of TNF-alpha or -beta (e.g. infectious or parasitic diseases, shock, cachexia, autoimmune diseases, adult respiratory distress syndrome etc., or side effects of treatment with assaying TNF and in study of TNF-receptor interactions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                        receptor peptide.

Example A; Page 47-48; 93pp; English.

CC Hybrid peptides for binding cytokines, comprising a malaria parasite (Plasmodium falciparum) peptide (capable of binding to a red blood CC cell (RBC)) and a receptor peptide are claimed. R70103-25 are examples of these hybrid peptides. R70104 is a fusion of tumour necrosis factor creceptor (in accordance with H Loetscher et al Cell, Vol. 61, 351-359) CC and glycophorin binding protein (GBP) homologue (GBPH). The use of CC cytokine receptors not normally found on RBCs means that the Cytokine receptors not normally found on RBCs means that the Cytokine can bind harmlessly to the RBC without deleterious effect. CC The RBC protects the hybrid peptides from excretion from the kidney, and CC due to steric hindrance prevents the cytokines binding to a receptor in CC another cell. GBP 130 or GBPH are the prefd. malaria parasite peptides used, others include EBA 175 (175 kDa erythrocyte binding antigen), PMMSA (pre major merozoite surface antigen) and the Duffy binding receptor conlecule (eg. exhibited by Plasmodium vivax). These peptides bind to CC pref. glycophorin A, B and C, sialo glycoproteins, found on the surface cytokines in the circulation to reduce pathological damage.

Title: >US-08-804-166-8 (1-336) from US08804166.pep 2541

Description: Perfect Score: Sequence: 1 SRTSLLLAFGLLCLPWLQEG......PSLPSPSRLPGPSDTPILPQ 336

Scoring table: PAM 150 Gap 11

Searched: 120446 seqs, 36531193 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: pir56 1:pir1 2:pir2 3:pir3 4:pir4 5:nrl3d

Statistics: Mean 42.414; Variance 82.038; scale 0.517

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

#title Soluble forms of tumor necrosis factor receptors (TNF-Rs).
The cDNA for the type I TNF-R, cloned using amino acid sequence data of its soluble form, encodes both the cell surface and a soluble form of the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   #journal Proc. There are at least five copies of CG-related genes and at least two
of these are expressed in the baboon placenta.
TION #superfamily pituitary glycoprotein hormone beta chain
glycoprotein; hormone; placenta; pregnancy maintenance
                                                                                                                   Resolution: not applicable
Determination: theoretical model
complex; glycoprotein hormone
phosphorylation; receptor
                                                                                                                                                                                                                                                                                                                                                         Jiang, X.; Dreano, M.; Buckler, D.R.; Cheng, S.; Ythi
Wu, H.; Hendrickson, W.A.; El Tayar, N.
Structure (London) (1996) 3:1341
Structural predictions for the ligand-binding region
glycoprotein hormone receptors and the nature of
hormone-receptor interactions structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Jiang, X.; Dreano, M.; Buckler, D.R.; Cheng, S.; Ythier, A.; Wu, H.; Hendrickson, W.A.; El Tayar, N. submitted to the Brookhaven Protein Data Bank, December 1996
                                                                                                                                                                                                       Hendrickson, W.A.

Structure (London) (1994) 2:545

Structure of human chorionic gonadotropin at 2.6 a from mad analysis of the selenomethionyl protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             chorionic gonadotropin, chain B - humanPDB_TITLE

Title: >US-08-804-166-8

Description: (1-336) from US08804166.pep
Perfect Score: 2541

Sequence: 1 SRTSLLLAFGLLCLPWLQEG......PSLPSPSRLPGPSDTFILPQ 336

Tabular output not generated.

searched: 69112 seqs, 25083644 residues

Scoring table:

PAM 150 Gap 11

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

swiss-prot35

Statistics: Mean 44.259; Variance 72.852; scale 0.608

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

THE RESULTING AGGREGATE CALLED THE DEATH-INDUCING SIGNALING COMPLEX (DISC) AGGREGATE CALLED THE DEATH-INDUCING SIGNALING COMPLEX (DISC) PERFORMS CASPASE-8 PROTEOLYTIC ACTIVATION WHICH INITIATES THE SUBSEQUENT CASCADE OF CASPASES (ASPARTATE-SPECIFIC CYSTEINE PROTEASES) MEDIATING APOPTOSIS (BY SIMILARITY).

-!- SUBGUIT: THE BINDING TO THE EXTRACELLULAR DOMAIN OF TWFRI LEADS TO HOMOTRIMERIZATION. ONCE AGGREGATED THE RECEPTORS DEATH DOMAINS PROVIDE A NOVEL MOLECULAR INTERFACE THAT INTERACTS SPECIFICALLY WITH THE DEATH DOMAIN OF TRADD. VARIOUS TRADD-INTERACTING PROTEINS SUCH AS TRAFS, RIP AND POSSIBLY FADD, ARE RECRUITED TO TNERIC COMPLEX BY THEIR ASSOCIATION WITH TRADD. THIS COMPLEX ACTIVATES AT LEAST TWO DISTINCT SIGNALING CASCADES, APOPTOSIS AND

IMMUNOL. 30:165-175(1993).

FUNCTION: RECEPTOR FOR THE ALPHA. THE ADAPTOR MOLECULE FADD RECRUITS CASPASE-8 TO THE ACTIVATED RECEPTOR. THE RESULTING AGGREGATE CALLED THE DEATH-INDUCING SIGNALING COMPLEX (DISC) PERFORMS CASPASE-8 PROTEOLYTIC ACTIVATION WHICH INITIATES THE SUBSEQUENT CASCADE OF CASPASES (ASPARTATE-SPECIFIC CYSTEINE SUBSEQUENT CASCADE OF CASPASES (ASPARTATE-SPECIFIC CYSTEINE PROTEASES) MEDIATING APOPTOSIS (BY SIMILARITY).

SUBUNIT: THE BINDING TO THE EXTRACELLULAR DOMAIN OF THER! LEAF HOMOTRIMERIZATION. ONCE AGGREGATED THE RECEPTORS DEATH DOMAINS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SVCPQGKYIHPQNNSICCTKCHKGTYLYNDCPGPGQDTDCRECESGSFTASENHLRHCL 82

VARIOUS TRADE-INTERACTING PROTEINS SUCH AS TRAFS, RIP AND POSSIBLY FADD, ARE RECRUITED TO THE COMPLEX BY THEIR ASSOCIATION WITH TRADD. THIS COMPLEX ACTIVATES AT LEAST TWO DISTLINCT SIGNALING CASCADES, APOPTOSIS AN NF-KAPPA B SIGNALING (BY SIMILARITY).

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

SUBCELLULAR CONTAINS A LA-NGER/TNER-TYPE CYSTEINE-RICH REGION.
                                                                                                                                                                                                                                                                            DSLCPQGKYVHSKNNSICCTKCHKGTYLVSDCPSPGRDTVCRECEKGTFTASQNYLRQCL 100

-I- FUNCTION: RECEPTOR FOR THE ALPHA. THE ADAPTOR MOLECULE FADD

RECRUITS CASPASE-8 TO THE ACTIVATED RECEPTOR. THE RESULTING

AGGREGATE CALLED THE DEATH-INDUCING SIGNALING COMPLEX (DISC)

PERFORMS CASPASE-8 PROTEOLYTIC ACTIVATION WHICH INITIATES THE

SUBSEQUENT CASCADE OF CASPASES (ASPARTATE-SPECIFIC CYSTEINE

PROTEASES) MEDIATING APOPTOSIS (BY SIMILARITY).

-I- SUBUNIT: THF BINDING TO THE EXTRACELLULAR DOMAIN OF THEN LEADS TO

HOMOTRIVERIZATION. ONCE AGGREGATED THE RECEPTORS DEATH DOMAINS

PROVIDE A NOVEL MOLECULAR INTERFACE THAT INTERACTS SPECIFICALLY

WITH THE DEATH DOMAIN OF TRADD. VARIOUS TRADD-THERECRUITED TO

TNFR1 COMPLEX BY THEIR ASSOCIATION WITH TRADD. THIS COMPLEX

ACTIVATES AT LEAST TWO DISTINCT SIGNALING CASCADES, APOPTOSIS AND
